HEARTBURN & REFUX
When you have something to eat or drink, it passes down the oesophagus (gullet) into the stomach and this flow of traffic should be one-way. However, reflux occurs when whatever happens to be in your stomach travels in the wrong direction back up into the oesophagus and commonly affects around 25% of adults1. Unlike vomiting, which is quite a violent activity, reflux mostly occurs without us being aware that it is happening.

WHAT IS OESOPHAGITIS?
Sometimes, even in people who have quite marked symptoms, the oesophagus may look entirely normal. However, some patients can develop oesophagitis (whenever you see a medical term ending in -itis, this indicates inflammation caused by irritation). When inflammation occurs, this suggests that there is damage to that part of the body. Quite simply, oesophagitis means that there is inflammation within the oesophagus and the lining of the inflamed oesophagus looks red and sore. If the inflammation is severe, ulcers can form. Much the commonest cause of oesophagitis is reflux of acid from the stomach and in around 8% of people, it can become moderate or severe.1

HOW DOES REFUX CAUSE OESOPHAGITIS?
The stomach makes acid, which helps to start off digestion by mixing with whatever we have to eat or drink. The acid is very strong so although the stomach is capable of resisting the acid, if it reflexes in sufficient quantities in to the oesophagus it will cause damage to the lining of the oesophagus.

At first the oesophageal lining may just appear rather more red than normal. However, later on, the lining of the oesophagus may begin to wear away and, in severe cases, an ulcer may form. The damage to the lining of the oesophagus may be made worse by the reflex of bile and pepsin, other digestive juices3.

SHOULD I SEE MY DOCTOR?
Heartburn is very common – almost 1 in 5 people experience symptoms at least once a year4. Most people who have symptoms can help themselves a lot by being sensible about what they eat and drink, and maybe also by taking antacids or other indigestion remedies that are available over the counter.

If these do not work or if you are worried, it would be a good idea to seek medical advice. It is also appropriate to consult your doctor if you have begun to have symptoms that just don’t seem to settle down. You should definitely see your doctor if you are having trouble swallowing and food seems to get stuck on its way down.

WHY AM I GETTING REFLUX?
In many cases it is unknown why the muscular ring – oesophageal sphincter - that prevents reflux is not working properly. Some people do seem prone to getting reflux – especially those who smoke, drink excess alcohol, women during pregnancy or those who put on weight. Wearing tight clothes, stooping or bending forwards and eating rich, fatty foods all seem to increase the tendency to reflux. There are individuals who seem to lead healthy lives and have none of the above ‘risk factors’ yet experience troublesome symptoms. Having a hiatus hernia (see below) makes reflux more likely. It is quite common for people to develop symptoms as a result of reflux when there are no signs of oesophagitis3. Doctors believe that, in such cases, the lining of the oesophagus is unusually sensitive to reflux of acid.

DOES REFUX ALWAYS CAUSE SYMPTOMS?
Certainly not. Almost all of us have a little reflux from time to time, with 5% suffering daily but many are unaware of its occurrence1. However, if reflux happens more often than normal, this can lead to symptoms developing.

WHAT SYMPTOMS MIGHT I EXPECT?
The most frequent symptom is heartburn, which is a burning sensation in the chest. Run your hand down your breastbone in the centre of your chest. Heartburn is often most noticed at the lowest end of the bone and the discomfort rises upwards to an extent that varies from individual to individual. Sometimes the burning feeling can reach all the way up to the throat2. Heartburn often seems worse after rich meals, citrus fruits, hot beverages or alcohol.

Occasionally it can be felt deeply within the chest – almost within the back. Some patients notice reflux when some of the contents of their stomach ‘repeat’ by coming back up the oesophagus as far as the throat or even the mouth. A few patients notice discomfort or pain as they swallow and may often experience frequent throat clearing, coughing and choking. It is quite common for these symptoms to be worse at night or when the patient lies down.

It is quite common for these symptoms to be worse at night or when the patient lies down.
WILL I NEED TESTS?
A doctor may diagnose reflux just by listening carefully when you describe your symptoms and may treat you without the need for any tests. If they are not sure however or if the treatment does not work well, it is probable that they will arrange investigations. The tests may be required to see whether you have Barrett’s oesophagus.

WHAT TESTS CAN I EXPECT?
The first investigation that doctors usually perform if they suspect you might have reflux oesophagitis is endoscopy. This involves passing a thin, flexible tube through the mouth and down into your oesophagus. The doctor will be able to get a good look at your oesophagus and stomach and check whether there are signs of inflammation. Although it sounds unpleasant, your doctor will take care to explain how the discomfort of the procedure will be minimised.

Although not used routinely, some specialists will choose to measure the amount of acid you are refluxing. By measuring the amount of acid in your oesophagus over a 24-hour period using a very narrow tube, passed through the nose, doctors can see the amount of acid produced and its pH. This is called pH monitoring and is shown below.

DOES IT MATTER IF I HAVE A HIATUS HERNIA?
The short answer is – not much. Instead of staying entirely in the belly as it should do, it is possible for part of the stomach to slide upwards into the chest. It does this by pushing itself through a hole (called the hiatus) in the diaphragm muscle. The hernia itself rarely causes any symptoms but it does seem to make reflux more likely.

Do note:
• that hiatus hernia is very common,
• that you can certainly have reflux without one and,
• that many people who have one do not get reflux.

The importance of having a hiatus hernia can certainly be overrated. Between 15 – 25% of people suffer from a hiatus hernia with it being more common in the male population.

SO WHAT IS THE BEST TREATMENT FOR REFUX SYMPTOMS?
Because the severity of the condition varies from being just an occasional nuisance for some people while others are quite seriously troubled, so the intensity of treatment varies from one individual to another. There may well be changes in your lifestyle that you can make to help. There are also medicines – either bought over the counter or prescribed by your doctor – that can help your symptoms. There is no simple ‘cure’.

HOW CAN I HELP MYSELF?
Your symptoms are likely to lessen if you take measures to reduce the amount of reflux that you have. It is a bad idea to eat large, rich meals – especially late in the evening so you can avoid going to bed with a full stomach. Propping up your head when you sleep may also alleviate symptoms. Eat little but more often if necessary. If you are carrying extra pounds, losing weight is usually very helpful and if you indulge, cut down on alcohol and stop smoking. Try to avoid bending forward or wearing tight clothes as this can put extra pressure on your tummy. There are also a variety of useful medicines that you can buy. Many contain antacids, which neutralize the acid in your stomach. Some contain a seaweed derivative (alginate) which acts as a barrier to stop acid from refluxing back up the oesophagus. Ask your pharmacist for advice about medicines that help reflux symptoms.
WHAT RESEARCH IS NEEDED?

It would be a major advance if we could work out what precisely is going wrong for reflux to occur. We don’t really understand why it happens so commonly and why some patients seem to have such unpleasant symptoms. Although treatment is effective, many patients notice their symptoms return soon after stopping their medicines. If we could work out what precisely is going wrong, we might then have a good chance of giving our patients lasting relief, prevent complications from happening and maybe even cure this condition. We also need more research to understand how Barrett’s oesophagus develops in patients with reflux.

IS REFLUX OESOPHAGITIS EVER SERIOUS?

For most people with the condition, reflux is just a nuisance and little more than that. In a few people, especially where there is severe inflammation of the oesophagus, there is a risk of complications that can include internal bleeding and narrowing of the gullet. In around 4% of patients Barrett’s oesophagus can develop. Whilst Barrett’s oesophagus can lead to oesophageal cancer it is rare for this to occur6. If you are worried about these complications, it is best to have a chat with your doctor.

NOTES:
- Conditions that affect the gut, the liver and the pancreas (collectively known as digestive diseases) are widespread but little known. They can cause significant health problems for people who live with them and, sadly, they are a factor in 1 in 8 UK deaths. Core is the only national charity working to change this by fighting all digestive diseases. As a charity, Core:
  - Supports important medical research that looks for cures and for ways of improving the lives of patients;
  - Provides evidence-based information that enables patients and families to understand and control their condition;
  - Works to raise awareness of these conditions, their symptoms and impact.

This leaflet was published by Core in 2014 and will be reviewed during 2016. If you are reading this after 2016 some of the information may be out of date. This leaflet was written under the direction of our Medical Director and has been subject to both lay and professional review.

All content provided for information only. The information found is not a substitute for professional medical care by a qualified doctor or other health care professional. ALWAYS check with your doctor if you have any concerns about your condition or treatment. The publishers are not responsible or liable, directly or indirectly, for ANY form of damages whatsoever resulting from the use (or misuse) of information contained in or implied by the information in this booklet.

Please contact us if you believe any information in this leaflet is in error.
This information booklet is produced by Core, the only national charity fighting all digestive diseases. Show your support for Core by making a donation today or by joining us as a Core Friend.

I would like to join Core Friends and will be making a Monthly/Quarterly/Annual donation of £

I have completed the Direct Debit form below and signed the Gift Aid declaration if appropriate.

I would like to support Core with a donation of £5 □ £10 □ £25 □ Other £

I have signed the Gift Aid declaration below.
